

# Mobile Tracking & Detection

Accurately detect and locate cell phones & recording devices throughout your facility.

Does someone in the board meeting have an open cellular connection that is streaming the meeting to someone on the outside? Has someone brought a personal cell phone into a facility in "Off" mode and then secretly turned it on? Has someone forgotten she has a cell phone in her pocket and entered a "no cell phone" area? As a security representative you want to know what those phones are doing, alerted of the situation, and where that device is before the individual can use the device illicitly.

## Secure any place where cell phones are not permitted

Detect and keep an audit trail to ensure that your no cell phone policy is enforced

- Board Meetings
- Executive Meetings
- Manufacturing Floors
- Research Labs

## Get the When and Where

Icons on a map allow you to see every cellular phone and mobile device's location within an area. By distinguishing between multiple devices, you have the ability to create a geo-fenced area within a facility, set a policy for that area, and receive an alert when a phone enters. For forensic investigations record all the cell phones seen, and their movements.

CELLULAR

BLUETOOTH

WI-FI

DVR

Other systems only track devices via Bluetooth and Wi-Fi. To know that your facility is secure against all unauthorized devices you need to go further. Our system has you fully covered because we trace and locate cellular signals in addition to Bluetooth and Wi-Fi..

Location accuracy is 1 to 3 meters.
