

Server Rack Access Control

Ensure your important data equipment is protected by making it only accessible by those you trust

Retrofittable Locking Devices

Designed to be installed onto a broad range of cabinets and enclosures. A retrofittable replacement for traditional manual swing-handle data center cabinet locks that offers many adaptor and mounting systems.

Fully Upgradable Manual Handle

Locking handle for data center cabinets offering genuine flexibility with an upgrade path from a manual swing-handle lock to an electronic lock.

Secondary Locking Mechanism

Secondary electronic lock mechanism for the top of a data cabinet. Available for cabinet and frame types where it is not acceptable to modify the door or to replace the existing hardware.

Door Status and Access in One Component

This access device visually communicates the status of the doors in the system and allows authorized users to open doors with a single button. Colored LEDs behind each button indicate the state of cabinet doors. Red indicates all doors are closed and secure while a flashing orange button indicates access is authorized and user may open an enclosure. A green button means that the door is not secure.
